

23 Hand-gear Trolley

The hand-gear trolley is recommended where the trolley motion is relatively infrequent or short, and especially for loads and beam heights where a plain push trolley would be impractical. The hand-gear trolley provides good load spotting ability.

The hand-gear trolley is available for all **LM** models, except **LM1**.

23.1 Hand-gear Trolley Type

The Hand-gear trolley uses the C-type trolley. See C-Type Trolley Section for size configuration, features and specifications.

23.2 Hand-gear Trolley Mounting Position

The hoist body position with respect to the girder is perpendicular as standard. A parallel mounting position (90° from standard) is available for **LM5** and **LM10** hoists only.

Perpendicular mounting position
